WHAT IS CLAIMED IS:

1. An apparatus comprising:

a device; and

a leak diversion device comprising a slanted surface positioned to contact fluid released from the device, wherein the fluid on the slanted surface flows down the slanted surface to a predetermined location viewable by a user of the device.

2. The apparatus of claim 1, wherein the leak diversion device is coupled to the device.

3. The apparatus of claim 1, wherein at least part of the slanted surface rests on a support to angle the slanted surface.

4. The apparatus of claim 1, wherein the device is selected from a group consisting of a dishwasher, refrigerator, sink, ice-maker, pipe, pump, storage container, and air conditioner.

5. The apparatus of claim 1, wherein the device is at least partially supported by the leak diversion device.

6. The apparatus of claim 5, wherein the slanted surface is placed inside a pallet that is at least partially supporting the device.

7. The apparatus of claim 6, wherein the slanted surface is attached to at least part of the pallet.

8. The apparatus of claim 1, further comprising a surface coupled to the leak

diversion device that has at least one hole to allow a fluid from the device to flow through at least one of the at least one hole onto the slanted surface.

9. The apparatus of claim 8, wherein the surface supports at least a part of the device.

10. The apparatus of claim 1, further comprising a permeable surface coupled to the leak diversion device to allow a fluid from the device to flow through the permeable surface onto the slanted surface.

11. The apparatus of claim 10, wherein the permeable surface supports at least a part of the device.

12. The apparatus of claim 1, wherein at least one side of the leak diversion device supports at least part of the weight of the device.

13. The apparatus of claim 1, further comprising a dye tab coupled to the slanted surface, wherein the dye tab changes a color of a fluid in contact with the dye.

14. The apparatus of claim 13, wherein the dye tab is positioned in the leak diversion device according to the color of the dye in the dye tab, wherein the fluid contacting the dye tab changes color and the color of the fluid indicates to a user an approximate location in the leak diversion device that the fluid flowed from respective to the location of the dye tab with the dye that colored the fluid.

15. The apparatus of claim 13, wherein the dye is in a powder form.

16. The apparatus of claim 13, wherein the dye tab reacts with a fluid to change the color of the fluid relative to the reaction.

17. The apparatus of claim 1, further comprising a hose coupled to the leak

diversion device to divert fluid from the slanted surface to a location outside the leak diversion device.

18. A method, comprising:

providing a leak diversion device comprising a slanted surface underneath a device; and

diverting fluid in contact with the leak diversion device along the slanted surface to a location that is visible to a user of the device.

19. The method of claim 18, further comprising dyeing the fluid on the slanted surface using a dye tab to increase the visibility of the fluid.

20. The method of claim 18, wherein the leak diversion device comprises a substantially flat surface with at least one hole above the slanted surface, wherein the substantially flat surface supports at least a part of the device and at least one hole of the at least one hole allows a fluid from the device to fall through the substantially flat surface to contact the slanted surface beneath.

21. A leak diversion device, comprising:

an impermeable surface configured to catch a fluid released from a device; and

a slanted inverted ridge in the impermeable surface, wherein a fluid contacting the impermeable surface flows toward the inverted ridge and down the slanted surface to a predetermined location viewable by a user of the device that released the fluid.

22. The leak diversion device of claim 21, further comprising a substantially flat permeable surface attached above the slanted surface, wherein fluid released from the

device flows past the permeable surface to the slanted surface.

23. The leak diversion device of claim 22, wherein the device is supported by the substantially flat permeable surface.

24. The leak diversion device of claim 21, further comprising at least two reinforced sides, wherein the device may be supported by the at least two reinforced sides above the slanted surface.

25. The leak diversion device of claim 21, further comprising at least one dye tab, wherein at least part of a fluid in contact with the dye tab changes color.
